

Question 3

Between writing SQL or using ORM (Object Relational Mapping) abstractions, which do you default to when starting a project from scratch and what libraries do you prefer when working with databases in Python?

it depends on how complex the working structure is, I use ORM because it is short, clean, and easy to maintain.

But when working with complex relational databases with many joins, it is better to use SQL statements.

In the end, each one has its pros and cons and depends on the scenario we are working on.
